

## Vehicle Traffic Counting and Classification for Vialidad Nacional

### Need

Vialidad Nacional (National Roadways Authority) requested through a public tender the supply of vehicle classifying counters to implement in all the districts in the country in order to make measurements for statistical purposes.

Exemys was awarded the contract with the TCT4400 family of equipment made in Argentina, which complied and exceeded the DNV expectations, in competition with imported products.

### Equipments

### Solution:

Exemys supplied DNV 100 traffic counters-classifiers, with a capacity to count and classify the total number of vehicles in Argentina.

The TCT4400 counter has four inputs for piezoelectric sensors, for inputs for hoses and 4 inputs for inductive spirals.

The acquisition of records is made by means of a telephone communication via modem, or by an external memory cartridge.
